1. Why Multiscale?

- Memory and plasticity involve brain mechanisms from molecular scale to enormous networks.
- We have developed MOOSE: the Multiscale Object Oriented Simulation Environment, to model plasticity and brain computation across scales.

2.2 Modelling Olfactory Bulb

The bulb model explains linear coding and phase-decorrelation and predicts connectivity, lateral dendrite output structure.

2.3 Modelling Cortex

- Predicts:**
- Excitatory-Inhibitory balance needed to avoid strongly oscillatory behaviour
 - Many weakly connected basket cells better at suppressing oscillations

2.4 Modelling Chemical Signalling Pathways

2.5 Robustness of Chemical Switches

Does parameter robustness imply noise robustness?

3. Summary

We use models to:

- Integrate many scales of neuronal data with basic physical/chemical principles.
- Explain phenomena of plasticity, activity and neuronal coding.
- Predict circuit mechanisms, plasticity rules, and emergent phenomena such as *decorrelation*, *robustness*, and *memory decay*.
